

NC Broadband Matters *Tech Topics*

Why Upstream **STILL** Matters

February 24, 2022

DOUG DAWSON, President, CCG Consulting

MARK BOXER, Technical Manager, OFS

Kent Winrich, CTO, Open Broadband

To our beloved Gene Scott

- Friend to us all
 - Visionary
- Lover of all things fiber
- Passion for making the world a better place

WE WILL MISS YOU,

BUT WE WILL MAKE SURE YOUR DREAMS COME TRUE

What Have We Learned About Upload Broadband During the Pandemic

DOUG DAWSON, PRESIDENT, CCG CONSULTING

What Have We Learned During the Pandemic

- We didn't have any appreciation of upload speeds before the pandemic.
- Many of us using upload broadband in new ways.
- Upload speeds can't support simultaneous sessions (people and students working from home at the same time).
- Home upload speeds are generally a lot slower than what the industry claims.

The Uses for Upload

- Connecting to School Servers
- Connecting to Work Servers
- Zoom and other Video Calls
- Cloud-based Software
- Collaboration Software
- Cloud Gaming
- Uploading Files
- Video sharing and Picture
- Cellphone Uploads (using home WiFi)
- Security Cameras
- Machine-to-machine traffic

Speed Tests

- Huge numbers of speed tests have been gathered during the last year. It's being collected by local governments, States, and federal agencies like the NTIA.
- An individual speed test is not a reliable judge of an ISP's quality – but large numbers of speed tests tell a great story.
- We've routinely seen ISPs delivering slower speeds than they claim in advertising and in reporting to the FCC.

Example of Speed Test Results

The following speed tests come from a real county in Wisconsin that CCG studies. The results represent almost 13,000 speed tests. These are the average results using the Ookla Speed test.

	Download (Mbps)	Upload (Mbps)
Charter/Spectrum	67.06	9.82
AT&T	11.37	5.16
CenturyLink	12.14	2.47
Frontier	7.25	0.93
WISP	4.61	1.99
Satellite	12.60	1.53
Fixed Cellular	18.32	2.28

Broadband Surveys and Interviews

CCG Consulting has conducted several surveys every month since the start of the pandemic. These are from all over the country in communities of a wide range of sizes. Here is what we learned:

- 30% of homes, including those using the cable company said they struggled to work and school from home during the pandemic.
- People with rural technologies like DSL were completely unable to work from home.
- Businesses had a hard time connecting to multiple employees at the same time – again because of upload speed limitations.

January Upload for North America

The following Comes from Sandvine for January 2022

RTP	15.46%
IPTV	11.20%
Google	8.45%
Netflix	6.53%
BitTorrent	6.37%
YouTube	3.50%
iCloud	2.93%
Dropbox	2.14%
Nest	2.13%
IPsec	1.90%

Other Lessons During the Pandemic

- Cable DOCSIS technology uses a noisy clutter piece of spectrum.
- Uploading is shared by the whole neighborhood in some technologies. When your neighbors are busy, the network quality degrades.
- Overcrowded networks have a cascading effect where lost packets have to be resent – making the network even busier.
- ISP speeds for many ISPs fluctuate wildly during the day.
- While evenings are still the busiest time in residential neighborhoods, the daytime usage caught up during the pandemic.
- Network performance usually varies by neighborhood.

Upload Demand has Exploded

- Per Openvault, average home upload usage grew 58% from 3Q 2019 to 3Q 2020.
- They have now quantified the average amount of uploading per home per month at 25 gigabytes – a number that would have astounded any network engineer a few years ago.
- It's the first time that many homes have cared about upload speeds.

Total Bandwidth Usage Continues to Grow

Average Monthly Home Broadband Usage From OpenVault:

1Q 2018 215 Gigabytes

1Q 2019 274 Gigabytes

1Q 2020 403 Gigabytes

1Q 2021 462 Gigabytes

Power Users Have Exploded

The percentage of households using more than 1 terabyte of data per month, per OpenVault:

4Q 2018	4.0%
4Q 2019	7.3 %
4Q 2020	14.1 %

Households Upgrading Speeds

Percentage of homes subscribed to various speed tiers from OpenVault:

	June 2020	June 2021
Under 50 Mbps	18.4%	10.5%
50 – 99 Mbps	20.4%	9.6%
100 – 199 Mbps	37.8%	47.5%
200 – 299 Mbps	13.5%	17.2%
500 – 999 Mbps	5.0%	4.7%
1 Gbps +	4.9%	10.5%

A Furukawa Company

In the beginning....asymmetric was the norm

The early internet

- All technologies were downstream-favored
- DSL, cable, wireless, satellite, even fiber
- This matched demand for the early internet

The screenshot shows the National Inventors Hall of Fame website. At the top, there is a navigation menu with links for Learning Resources, Blog, Sponsor and Donate, At-home STEM Kits, and Register for Car. Below the navigation, there are dropdown menus for Programs, Educators, Museum, Inductees, Events, and Competitions. The main content area features a black and white portrait of Joseph Lechleider, an elderly man with a white beard. To the right of the portrait, his name is displayed in a large font, followed by his invention, DSL - Digital Subscriber Line, his US Patent No. 5,181,198, and his induction year, 2013. Below this, his birth and death dates are listed: Born February 22, 1933 - Died April 18, 2015. A paragraph of text describes his contribution: "Although inventors such as Alexander Graham Bell and Samuel Morse had speculated that data other than voice information could be transmitted over copper wire, it was Joe Lechleider of Bellcore who first presented the basis for doing so through mathematical analysis and first demonstrated the feasibility of sending broadband signals over copper."

Crosstalk reduced with asymmetric speeds

Today - Remote everything

- Many communication trends formed during the Covid response are here to stay
- Remote work
- Remote play
- Remote healthcare
- Some remote learning
- All require significant amounts of upstream bandwidth

Bandwidth Demand Will Likely Exceed Gigabit Symmetrical

PROJECTED PEAK BANDWIDTH REQUIREMENTS - HOUSEHOLD OF 4

- Does not include Robotics
- Early adopters, Radiologists, Power Users/Gamers, others may require much more

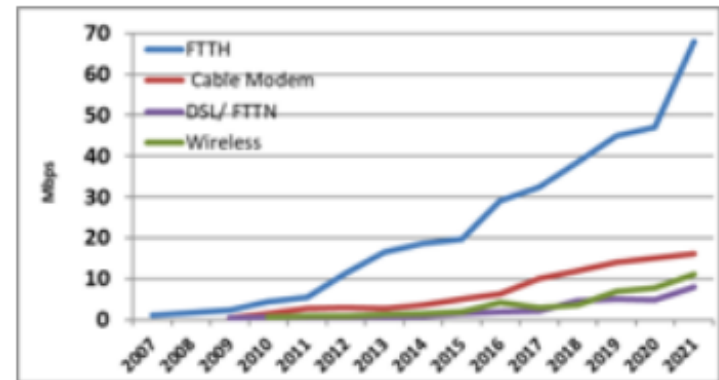

Source: Fiber Broadband Association Technology Committee

FBA TECHNOLOGY COMMITTEE BANDWIDTH DEMAND FORECAST

In the long run, fiber is the answer

- Only fiber **can scale** to meet both downstream **and upstream** bandwidth demands long-term
- Other technologies can assist short-term, but Fiber to the Home should be a long-term goal for digital equity

- Cable/DSL/wireless (and satellite) do not have the upstream capacity of fiber. Where fiber can effortlessly scale with demand, other technologies have upstream limitations.

Only Fiber Can Deliver the Required Tested Upload Speeds – RVA Consumer Studies

open
broadband

Symmetrical vs Asymmetrical Broadband

- Symmetrical – Download and Upload are the same rate
- Asymmetrical – Download is faster than the upload

Examples of Symmetrical

- SOME Fiber Deployments
- SOME Wireless Deployments

Examples of Asymmetrical

- ALL Cable
- GPON <--- YES, GPON**
 - GPON 2.488 down, 1.244 up PER PORT
 - XGPON 9.95 down, 2.48 up PER PORT
- Some Wireless
- ALL Cell, including 5G

High Speed Internet 50

\$34.99/mo. **\$19.99/mo. for 6 months!**

Download speed: 50 Mbps and upload speed: 10 Mbps

High Speed Internet 500

\$69.99/mo. **\$49.99/mo. for 6 months!**

Download speed: 500 Mbps and upload speed: 100 Mbps

High Speed Internet 100

\$49.99/mo. **\$29.99/mo. for 6 months!**

Download speed: 100 Mbps and upload speed: 20 Mbps

Gigabit Internet 1000

\$89.99/mo. **\$59.99/mo. for 6 months!**

The fastest residential speed available delivered to your home by Hotwire's state-of-the-art fiber network. Speeds up to 1 Gbps (That's 1,000 Mbps) download and up to 200 Mbps upload.

Why Am I Promoting Asymmetrical?

- More technologies to fill in the Digital Divide
 - We are going to need all tools available
 - Supply Chain is a HUGE issue!
- TRUE Broadband Utilization

Lets Talk About Utilization

New Study Examines Internet Traffic Patterns and Bandwidth Requirements

July 15, 2021

As America climbs out of the COVID-19 pandemic, cable's broadband networks continue to prove their ability to handle unprecedented spikes in internet traffic—from the state lockdowns of last spring when more people than ever before connected online, to the present day as businesses and schools begin to experiment with new hybrid working models. But no matter what the “new normal” will be, one certainty is the importance of a reliable and robust broadband connection.

As we step back and assess how networks handled the pandemic surge in traffic, a new report by Cartesian, a consulting group with expertise in telecommunications, shines some light on how traffic flows over the network, how much bandwidth popular applications utilize, and how multi-person household needs vary depending on usage patterns. The [full report can be found here](#).
